

Portable "Leg-Less" Fish Cleaning Station

Abstract

A compact, light-weight, portable fish cleaning station which can be removably mounted on the outside surface of any marine piling, vertical post, tree or pole greater than 2 inches in diameter. The station is used to hold a fish for cleaning or cutting while allowing drainage of waste material into the water or bucket, when attached. The station includes a cutting board of wood and/or moldable structured plastic attached to two vertical support arms that are temporarily aligned over the face of a support piling and securely tied in position with the attached rope and cleat. The vertical support arms are designed with four primary contact points that insure a secure fit and prevent "wobble". The width of the support arms is sufficient so that the station may be used on pilings or posts of various diameters. The station can be positioned at various heights for the comfort of the user. The station is easily removed from the piling, tree, post or vertical support and fold for easy storage.
